

Beyond social semantics

Embodied cognition and language learning

How to interpret SLA research?

COGNITIVISM

- CURRENT PARADIGM

EMBODIED COGNITION

- EMERGING PARADIGM

Presenter: Malcolm Kirkwood

This presentation

- 1) Cognition is social
- 2) Language is embodied
- 3) Language is sensorimotor
- 4) Meaning is universal
- 5) Memory is contextual and procedural

THE UNIVERSITY
OF QUEENSLAND
AUSTRALIA

ICTE-UQ

Point 1: COGNITION is SOCIAL

Which card/s do I need to turn to check the rule is not being broken?

“If a card has a vowel on one side, then it has an odd number on the other.”

Who do I need to check from among these 4 patrons to make sure that no one is doing anything wrong?

Drinking
beer

Drinking
coke

16 years
of age

22 years
of age

You have a simple rule to follow:

**“If a person is drinking alcohol,
than they must be at least 18
years of age.”**

The science

Wason and Johnson-Laird (1970) administered both variants of the same logical reasoning test. With the administration of the social version of the task, they obtain the following 1st (abstract) test:

Percentage of choices in the concrete 'social' Wason selection				
Cards chosen	BEER and 16	BEER AND 22	BEER	BEER, 22 and 16
Expressed logically	P and not Q (correct)	P and Q	P only	P, Q and not-q
Percentage of respondents choosing this response	77%	0%	20%	3%

COGNITIVISM

interpretations

EMBODIED COGNITION

- EPISTEMIC COGNITION

- DEONTIC COGNITION

- STIMULI PROCESSED EQUALLY

- SOCIOEMOTIONAL STIMULI
PROCESSED PREFERENTIALLY

Cognition is

social! TAKEAWAY #1:

Language learners should learn in contexts defined by social interactions.

Language should be modelled to reflect typical interpersonal or transactional interactions.

Use rules to reinforce, though not introduce, syntax and grammar.

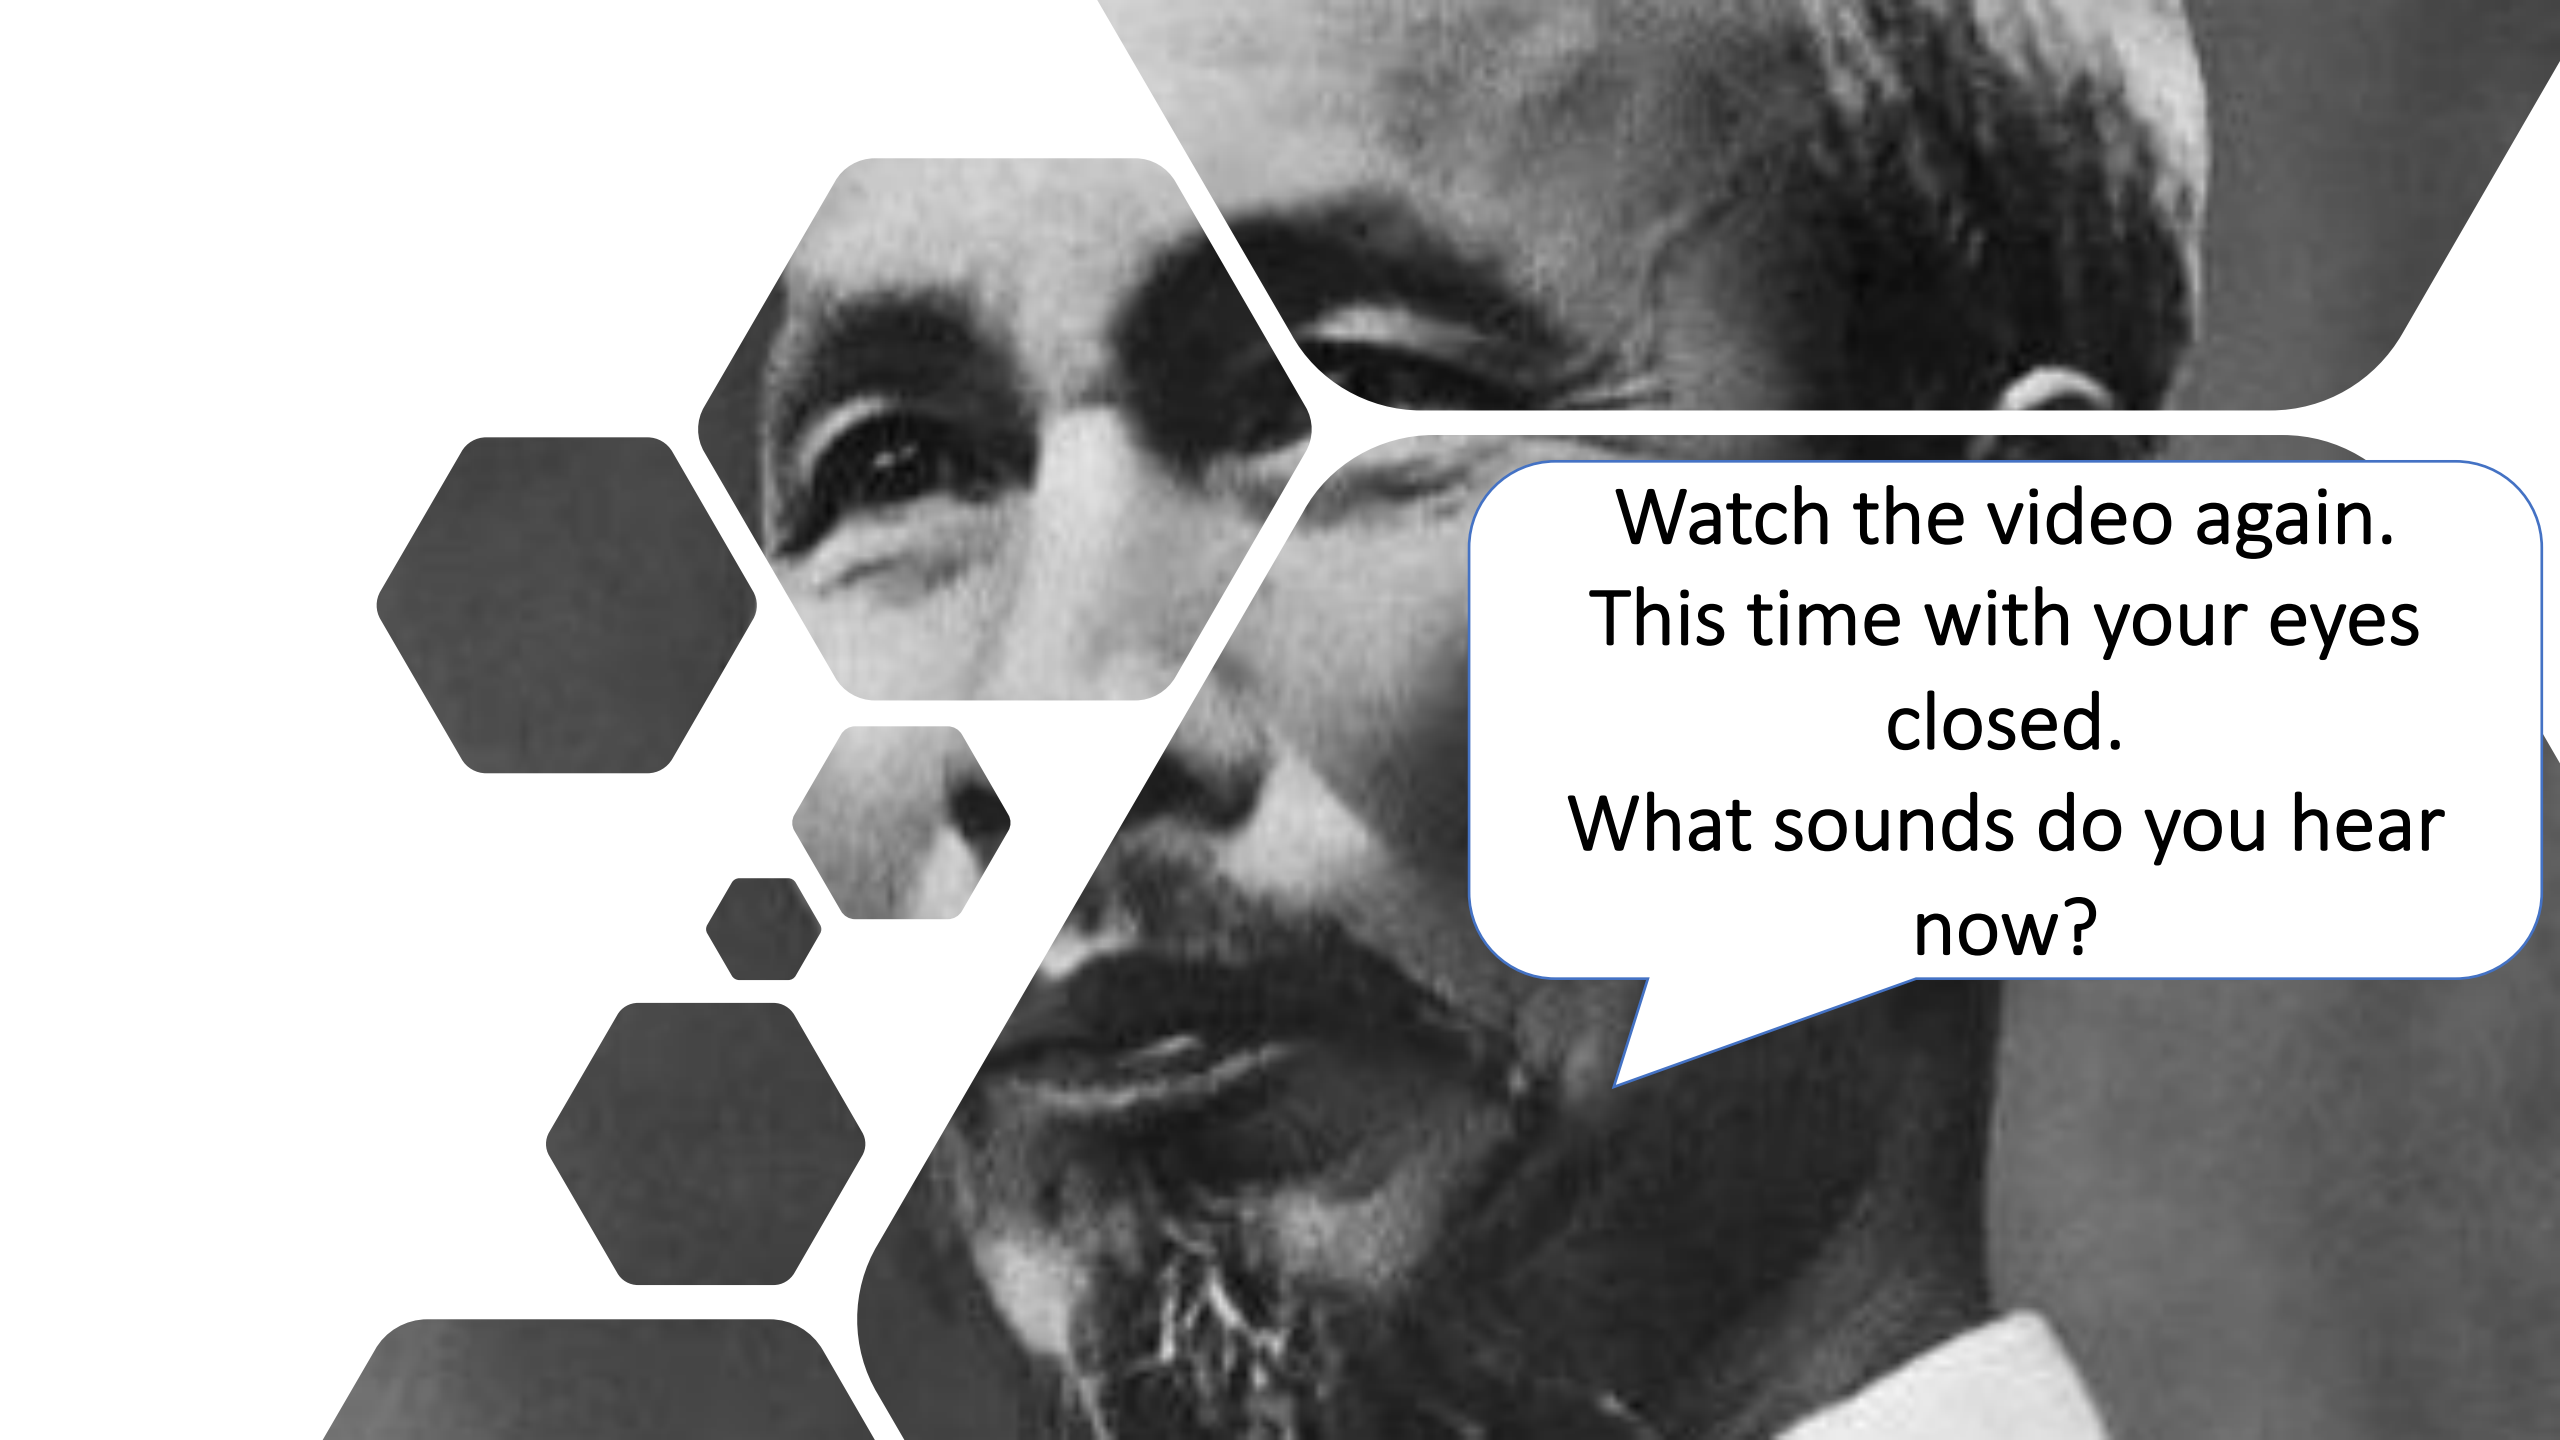

Point 2: LANGUAGE is EMBODIED

Watch the following video
carefully.

What sounds do you hear?

Watch the video again.
This time with your eyes
closed.
What sounds do you hear
now?

In each segment, I
said “Ba Ba Ba Ba
Ba Ba”

However, the 3rd –
6th presentations
were
incongruent...

Leading to the
illusion of the
McGurk effect!!

How would you explain the McGurk effect?

Anyone sleepy?

There is a neurological connection
between **observed** and **imagined**
actions!

The **mirror neuron** system

THE MIRROR
NEURON
SYSTEM
(MNS)

Mirror neurons

The mirror neuron system is responsible for social learning including **language**.

This is because mirror neurons coordinate **sensory**, **motor** and **language** processes.

Some Brain Areas Active During Gesture, Speech or Both

LEFT HEMISPHERE

RIGHT HEMISPHERE

-  In studies of gesture-speech integration
-  Speech at the word level
-  Speech at the sentence level

Correspondingly, **LANGUAGE** has a semantic basis in
BODY ORIENTATION

Lakoff and Johnson (1999) have researched
CONCEPTUAL METAPHORS

Can you **grasp** the idea? If so, things are **looking up**!

Conceptual metaphors: embodied basis

1. Multiple experiences share the same bodily pattern

2. A simple mental representation conveys these elements

3. Unconscious application of schema in abstract domains

Bodily experience

Embodied schema

Embodied metaphor

I can **balance**
the equation
by adding an
x

COGNITIVISM

interpretations

EMBODIED COGNITION

- The McGurk effect is due to the physics of the auditory system.
- The McGurk effect demonstrates the dominance of visual to auditory speech stimuli
- The McGurk effect is due to imitative neural activity (i.e. sensorimotor mirror neuron activity)
- The McGurk effect demonstrates that language is primarily visual. This is because verbal language is an extension of gestural language.

Language is embodied!

TAKEAWAY #2:

Prioritise physical enactment when teaching language.

POINT 3:

Language is
sensorimotor

What is this?

Try to match these objects with their correct names

A

B

C

Trucker's friend

Timber scribe

Kitchen mate

Now, try to match these objects with their correct names

A

B

C

Capacitator

Distributor

Alternator

Why was it easier to identify the LIKELY names for the first three items?

The short answer is that we have either used, or have seen other people use, similar objects.

- ☐ Auditory
- ☐ Visual
- ☐ Motor
- ☐ Gustatory
- ☐ Olfactory
- ☒ Proprioceptive
- ☐ Nociceptive
- ☐ Emotional

familiar things

On the other hand, most of us don't have sensorimotor representations of things like distributors

RETURNING TO OUR *MYSTERY OBJECT*...

Have a go at using it...

How would you define it?
What would be a suitable name for it?

POSSIBLE DEFINITION:

A type of (lever / tool) that (stamps) letters (onto a golf ball)

POSSIBLE NAME: **Golf ball letter stamper**

IN CONCLUSION:
WE CAN EASILY PROVIDE A WORKING DEFINITION OF A
GOLF BALL MONOGRAMMER (n.)...

...AS WE HAVE **SENSORIMOTOR REPRESENTATIONS** STORED FROM
USING, OR SEEING PEOPLE USE, SIMILAR TOOLS

But how does this
relate to language
learning?

These **simulations**
become more
abstract (and off-line).
This is called
**procedural
memory**.

We gain **declarative
knowledge** from the
brain's storage of
sensorimotor experiences
early in development.

And as such, language is
SENSORIMOTOR!!

Language, whether L1 or L2, relies on the same
simulatory
mechanisms that underlie
declarative and
procedural
knowledge.

This is the case even for **ABSTRACT CONCEPTS** as all concepts have a sensorimotor basis!!

COGNITIVISM

interpretations

EMBODIED COGNITION

- Language is symbolic (amodal)

- Words matched to symbolic referents in an arbitrary manner. Words are stored separately from related imagery in long-term memory.

- Language is non-symbolic (modal) and is deeply embodied.

- Linguistic knowledge is holistic / supported by sensorimotor models (simulations).

Knowledge is **sensorimotor!**

TAKEAWAY #3:

Knowledge is grounded in the real world....including our interactions with our surroundings and with each other. Therefore:

Language learners should learn language in authentic, multimodal contexts

Point 4: MEANING is UNIVERSAL!

Vendre la mèche!

泄露天机
xiè lù tiān jī

口が滑る (くちがすべる)

One of these sentences

C It was hard not to **spill the beans** when I heard such a juicy piece of gossip.

A It was hard not to spill the
Vuotato il sacco!

Spill the beans is
idiomatically
universal!

d on the hot pan

Wysypać fasolę

ny way out of the kitchen.

C It was hard not to **پھلیاں گرن** the beans when I heard such a juicy piece of gossip.

Kumwaga mchele mbele ya kuku.

Brain correlates of idiomatic sentences

Conclusion: semantic representations grounded in the sensory-motor system are involved in comprehension of idioms!

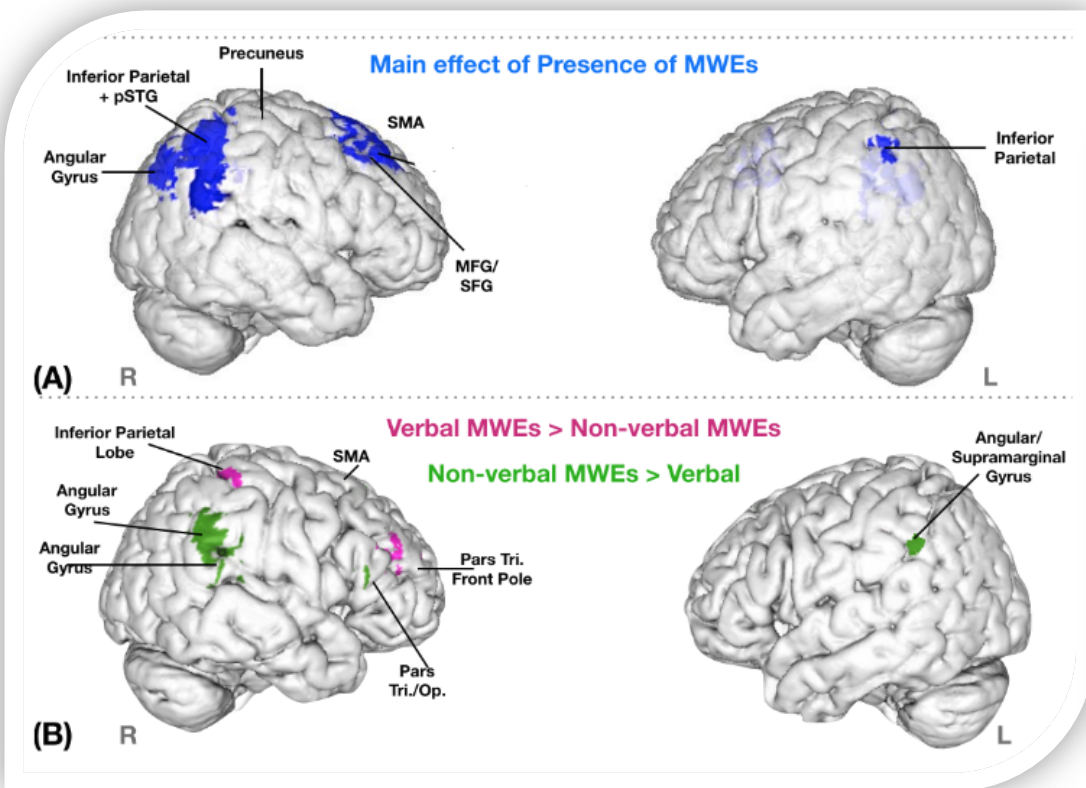

Idiomatic sentences activated sensory and motor cortex while literal sentences did not.

Importantly, they found greatest activation in motor-sensory areas as readers completed reading sentences.

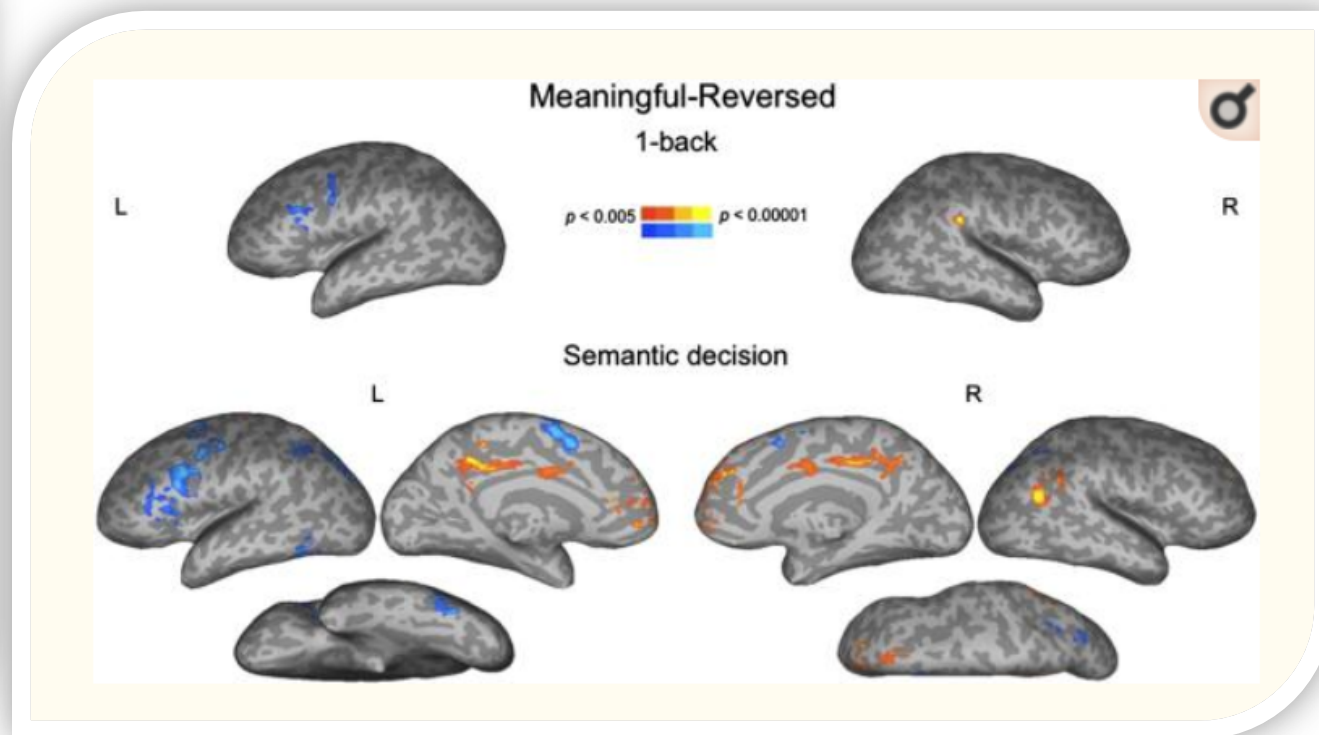

LATE ANALYSIS WINDOW

Brain imaging research shows similar results in L1 / L2 learners for **formulaic language**

Multiword expressions (MWEs)

Meaningful collocations
(semantic vs lexical processing)

BRACE YOURSELVES!!

There is no **universal** grammar!

However – **MEANING IS UNIVERSAL** as each language (presumably) has equivalent concepts and corresponding formulaic language structures

AND

the brain processes formulaic language similarly via its sensorimotor systems

(ma
ca

COGNITIVISM

interpretations

EMBODIED COGNITION

- Semantics operate according to statistical regularities in word processing.

- Sensorimotor involvement may occur as a consequence of symbolic cognition.

- Semantics operates due to the convergence of emotional, sensory, and motor information.

- Sensorimotor activity is present at all stages of language learning / processing.

Meaning is universal!

TAKEAWAY #4:

Language learners should be exposed to meaningful multiword expressions which convey meaning across languages.

Learning vocabulary in isolation may be inadequate for simulatory reactivation.

What were your feelings?

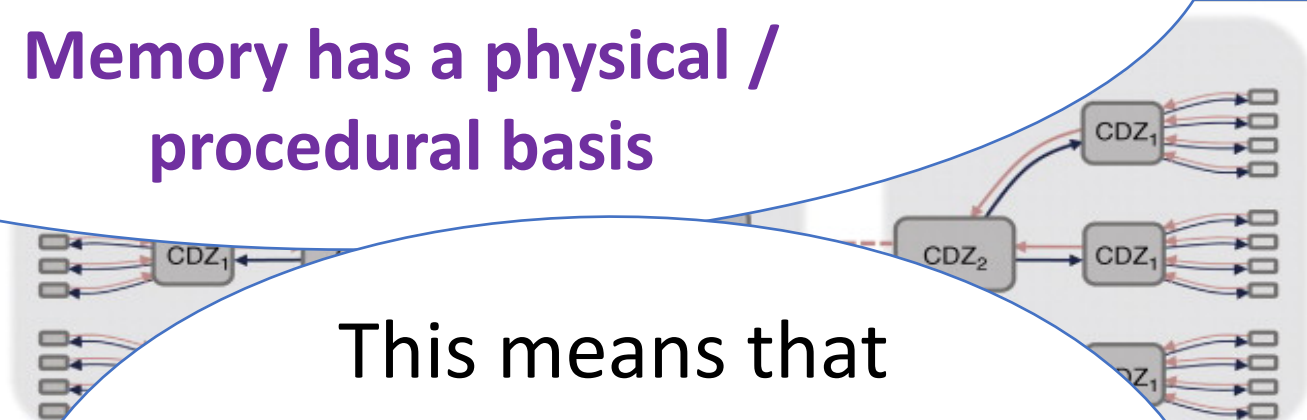

**How would you describe
the memory of something so familiar?**

Memory is a consequence of how the brain organises input by sensory modality

- Emotions are linked with reward or avoidance
- Memory has a physical / procedural basis

nal and
lient.

This means that
memory is necessarily
contextual.

**It is your guide to
the future!**

Antonio Damasio (founder and director
of the USC Brain and Creativity Institute)

1

2

1. Who is this?
2. What is she doing?
3. Where and when?
4. Why

3

4

4

In the final picture we can easily answer all of the questions including 'why'

Appropriate context = sensorimotor / emotional simulation

The normal context includes:
bodies, cognitive tools, social practices and expected environmental features.

COGNITIVISM

interpretations

EMBODIED COGNITION

- Memory is divided between working and long-term memory.

- Memory is comprised of schema and procedural and declarative memory is distinct.

- Memory is holistic and linked to the original mode/s of perception including emotion.

- Memory contains 'internal models' which are comprised of (largely) automated declarative and procedural knowledge.

Memory is contextual and procedural!

TAKEAWAY #5:

Meaningful memory processes for language learners are activated by socioemotional and procedural contexts.

Now, recall the word or phrase that you learnt earlier...

TASK: Me

TASK: Memorise the bolded word (below):

What is The
Condition 1:
Condition 2:
Condition 3:

Karn-w
Karn-w
Karn-w

Thai	English
Karn-wai-nam ku kwam sanuk!	Swimming is great fun!
Karn-wai-nam = swimming / Ku kwarm = is / sanuk = fun	
	

Fake news! So sad...

In Summary...

COGNITION is SOCIAL

Language learners should learn in contexts defined by social interactions (and not ONLY from abstract rules).

LANGUAGE is EMBODIED

Prioritise physical enactment when teaching language.

LANGUAGE is SENSORIMOTOR

Language learners should learn language in authentic,
multimodal contexts

MEANING is UNIVERSAL

Language learners should be exposed to meaningful multiword expressions which convey meaning across languages.

MEMORY is CONTEXTURAL and PROCEDURAL

Meaningful memory processes for language learners are actuated by socioemotional and procedural contexts.
